DECLARATION

I hereby declare that the work presented in this report entitled “ONLINE TIFFIN SERVICE SYSTEM”, was carried out by me. I have not submitted the matter embodied in this report for the award of any other degree or diploma of any other University or Institute.

I have given due credit to the original authors/sources for all the words, ideas, diagrams, graphics, computer programs, experiments, results, that are not my original contribution. I have used quotation marks to identify verbatim sentences and given credit to the original authors/sources.

I affirm that no portion of my work is plagiarized, and the experiments and results reported in the report are not manipulated. In the event of a complaint of plagiarism and the manipulation of the experiments and results, I shall be fully responsible and answerable.

KAPIL KUMAR (1900290140018)

DEVENDRA RAI (1900290140013)

ABHISHEK JHA (1900290140001)

(Candidate Signature)

CERTIFICATE

Certified that **KAPIL KUMAR**
(1900290140018), DEVENDRA RAI (1900290140013),
ABHISHEK JHA (1900290140001) has carried out the
research work presented in this thesis entitled **“ONLINE**
TIFFIN SERVICE SYSTEM” for the award of
MASTER OF COMPUTER APPLICATION from Dr.
APJ Abdul Kalam Technical University, Lucknow under
my supervision. The thesis embodies results of original
work, and studies are carried out by the student
himself/herself (print only that is applicable) and the
contents of the thesis do not form the basis for the award
of any other degree to the candidate or to anybody else
from this or any other University/Institution.

ABSTRACT

Online Tiffin Service System (OTSS) is an established concept which is used to manage online Tiffin services lifecycle through various technologies and process oriented tools. This study identifies how web application can be utilized to provide food services to the customers and to understand the potential of web application in the business environment.

Online Tiffin Service System is a web based application which allows the administrator to handle all the activities online quickly and safely. Using Interactive GUI anyone can quickly learn to use the complete system. This system will give power and flexibility to administrator to manage the entire system from a single online portal.

In Online Tiffin Service System we use PHP and MySQL Database. This project keeps the records of Tiffin orders. This project has two module i.e. admin and user.

The aim of doing this project is to have practical knowledge of Tiffin service's team and their actual performance in the supply and management of food delivery service. Now a day's readymade food is easily available but homemade food and its taste is a different matter. In our busy schedule fresh and homemade food preparation is difficult in early mornings. But it is made possible by Tiffin service carry homemade food and deliver the same before our lunch time.

This web application allows food seekers to directly order a Tiffin for their afternoon lunch online. This application is built to be beneficial to student knowledge as well as help Tiffin service provider.

ACKNOWLEDGEMENTS

I would like to express my sincere gratitude to several individuals and organizations for supporting me throughout my Project. First, I wish to express my sincere gratitude to my supervisor, Dr. Vipin Kumar (Associate Professor), for his enthusiasm, patience, insightful comments, helpful information, practical advice and unceasing ideas that have helped me tremendously at all times in my research and writing of this thesis. His immense knowledge, profound experience and professional expertise in Data Quality Control has enabled me to complete this research successfully. Without his support and guidance, this project would not have been possible. I could not have imagined having a better supervisor in my study.

Bibliography

Online Tiffin Service System (OTSS) is an established concept which is used to manage online Tiffin services lifecycle through various technologies and process oriented tools. This study identifies how web application can be utilized to provide food services to the customers and to understand the potential of web application in the business environment.

Introduction

Introduction:-

Online Tiffin Service System is a web based application which allows the administrator to handle all the activities online quickly and safely. Using Interactive GUI anyone can quickly learn to use the complete system. This system will give power and flexibility to administrator to manage the entire system from a single online portal.

In Online Tiffin Service System we use PHP and MySQL Database. This project keeps the records of Tiffin orders. This project has two module i.e. admin and user.

Admin Module

- 1. Dashboard:** In this section, admin can briefly view the total new orders, total confirmed orders, total cancelled orders and total orders.
- 2. Tiffin:** In this section, admin can manage Tiffin (Add/Update).
- 3. Order:** In this section admin can view the Tiffin order details and they have also right to change order status according to current status.
- 4. Invoices:** In this section, admin can view invoices of the tiffin orders and also take print of invoice.
- 5. Reports:** In this section admin can view the Tiffin details and check the sales reports (month wise/year wise) in a particular period.
- 6. Search Invoice:** In this section, admin can search Tiffin invoice with the help of customer invoice number, Name and Mobile Number.

- 7. Search Order:** In this section, admin can search tiffin orders invoice with the help of customer invoice number, Name and Mobile Number.

Admin can also update his profile, change the password and recover the password.

User Module

1. Home Page: In this section, user can view home page of web application and also view which food available in Tiffin service and order that food.
2. My orders: In this section, user can view order history and invoice after login.
3. My Profile: In this section, user can view and update his/her profile.
4. Setting: In this section, user can change his/her password.
5. Log out: The user can be logged off the system using this module.

Brief Information about the homepage

In this page guest user (user which not registered) can view Tiffin service, view about us and contact us of Tiffin provider and the guest user can also sign in and signup with Tiffin provider.

Objective

The aim of doing this project is to have practical knowledge of Tiffin service's team and their actual performance in the supply and management of food delivery service.

Now a day's readymade food is easily available but homemade food and its taste is a different matter. In our busy schedule fresh and homemade food preparation is difficult in early mornings. But it is made possible by Tiffin service carry homemade food and deliver the same before our lunch time. This web application allows food seekers to directly order a Tiffin for their afternoon lunch online. This application is built to be beneficial to student knowledge as well as help Tiffin service provider.

Existing System

The present scenario offers manual data entry. A lot of time is wasted in creating the reports as well as maintaining them. In case, if any query arises to get the information about the customer, the whole report is re-typed or xeroxed. This seriously affects the authentication of the system. This Online Tiffin Service System is totally outdated and involves high risk of ambiguity and redundancy.

Proposed System

The proposed Online Tiffin Service System is to have everything completely automated and computerized. The software is very easy to use and manage even for a non technical person. The redundancy and ambiguity will be removed by assigning every customer a unique order number.

Advantages of Online Tiffin Service System

- Website can be easily accessible to the customers and saves their time.

- It eliminates the use of ordering through phone that causes incessant load on the workers in taking and processing orders whereas online ordering automates this process.
- Customers can order online at any time of the day.

Disadvantages of Online Tiffin Service System

- One cannot cancel the order once given.

Requirement Specification

Hardware Configuration :

Client Side:

RAM	512 MB
Hard disk	10 GB
Processor	1.0 GHz

Table 1

Server side:

RAM	1 GB
Hard disk	20 GB
Processor	2.0 GHz

Table 2

Software Requirement:

Client Side:

Web Browser	Google Chrome or any compatible browser
Operating System	Windows or any equivalent OS

Table 3

Server Side:

Web Server	APACHE
Server side Language	PHP5.6 or above version
Database Server	MYSQL
Web Browser	Google Chrome or any compatible browser
Operating System	Windows or any equivalent OS

Table 4

APACHE

The Apache HTTP Server Project is an effort to develop and maintain an open-source HTTP server for modern operating systems including UNIX and Windows. The goal of this project is to provide a secure, efficient and extensible server that provides HTTP services in sync with the current HTTP standards.

The Apache HTTP Server ("httpd") was launched in 1995 and it has been the most popular web server on the Internet since April 1996. It has celebrated its 20th birthday as a project in February 2015.

PHP

- PHP stands for PHP: Hypertext Preprocessor.

- PHP is a server-side scripting language, like ASP.
- PHP scripts are executed on the server.
- PHP supports many databases (MYSQL, Informix, Oracle, Sybase, Solid, Generic ODBC, etc.).
- PHP is an open source software .
- PHP is free to download and use.

MYSQL

- MYSQL is a database server
- MYSQL is ideal for both small and large applications
- MYSQL supports standard SQL
- MYSQL compiles on a number of platforms
- MYSQL is free to download and use

How to access MySQL: <http://localhost/phpmyadmin>

Analysis and Design

Analysis:

The present scenario offers manual data entry. A lot of time is wasted in creating the reports as well as maintaining them. In case, if any query arises to get the information about the client, the whole report is re-typed or Xeroxed. This seriously affects the authentication of the system. This Client Management System is totally outdated and involves high risk of ambiguity and redundancy.

Disadvantage of present system:

- **Not user friendly:** The present system not user friendly because data is not stored in structure and proper format.
- **Manual Control:** All report calculation is done manually so there is a chance of error.
- **Lots of paper work:** Visitors maintain in the register so lots of paper require storing details.
- **Time consuming**

Design Introduction:

Design is the first step in the development phase for any techniques and principles for the purpose of defining a device, a process or system in

sufficient detail to permit its physical realization.

Once the software requirements have been analyzed and specified the software design involves three technical activities - design, coding, implementation and testing that are required to build and verify the software.

The design activities are of main importance in this phase, because in this activity, decisions ultimately affecting the success of the software implementation and its ease of maintenance are made. These decisions have the final bearing upon reliability and maintainability of the system. Design is the only way to accurately translate the customer's requirements into finished software or a system.

Design is the place where quality is fostered in development. Software design is a process through which requirements are translated into a representation of software. Software design is conducted in two steps. Preliminary design is concerned with the transformation of requirements into data

UML Diagrams:

Actor:

A coherent set of roles that users of use cases play when interacting with the use cases.

Use case: A description of sequence of actions, including variants, that a system performs that yields an observable result of value of an actor.

UML stands for Unified Modeling Language. UML is a language for specifying, visualizing and documenting the system. This is the step while developing any product after analysis. The goal from this is to produce a model of the entities involved in the project which later need to be built. The representation of the entities that are to be used in the product being developed need to be designed.

USECASE DIAGRAMS:

Use case diagrams model behavior within a system and helps the developers understand of what the user require. The stick man represents what's called an actor.

Use case diagram can be useful for getting an overall view of the system and clarifying who can do and more importantly what they can't do.

Use case diagram consists of use cases and actors and shows the interaction between the use case and actors.

- The purpose is to show the interactions between the use case and actor.
- To represent the system requirements from user's perspective.
- An actor could be the end-user of the system or an external system.

USECASE DIAGRAM: A Use case is a description of set of sequence of actions. Graphically it is rendered as an ellipse with solid line including only its name. Use case diagram is a behavioral diagram that shows a set of use cases and actors and their relationship. It is an association between the use cases and actors. An actor represents a real-world object. Primary Actor – Sender, Secondary Actor Receiver.

Use Case Diagrams:

Admin

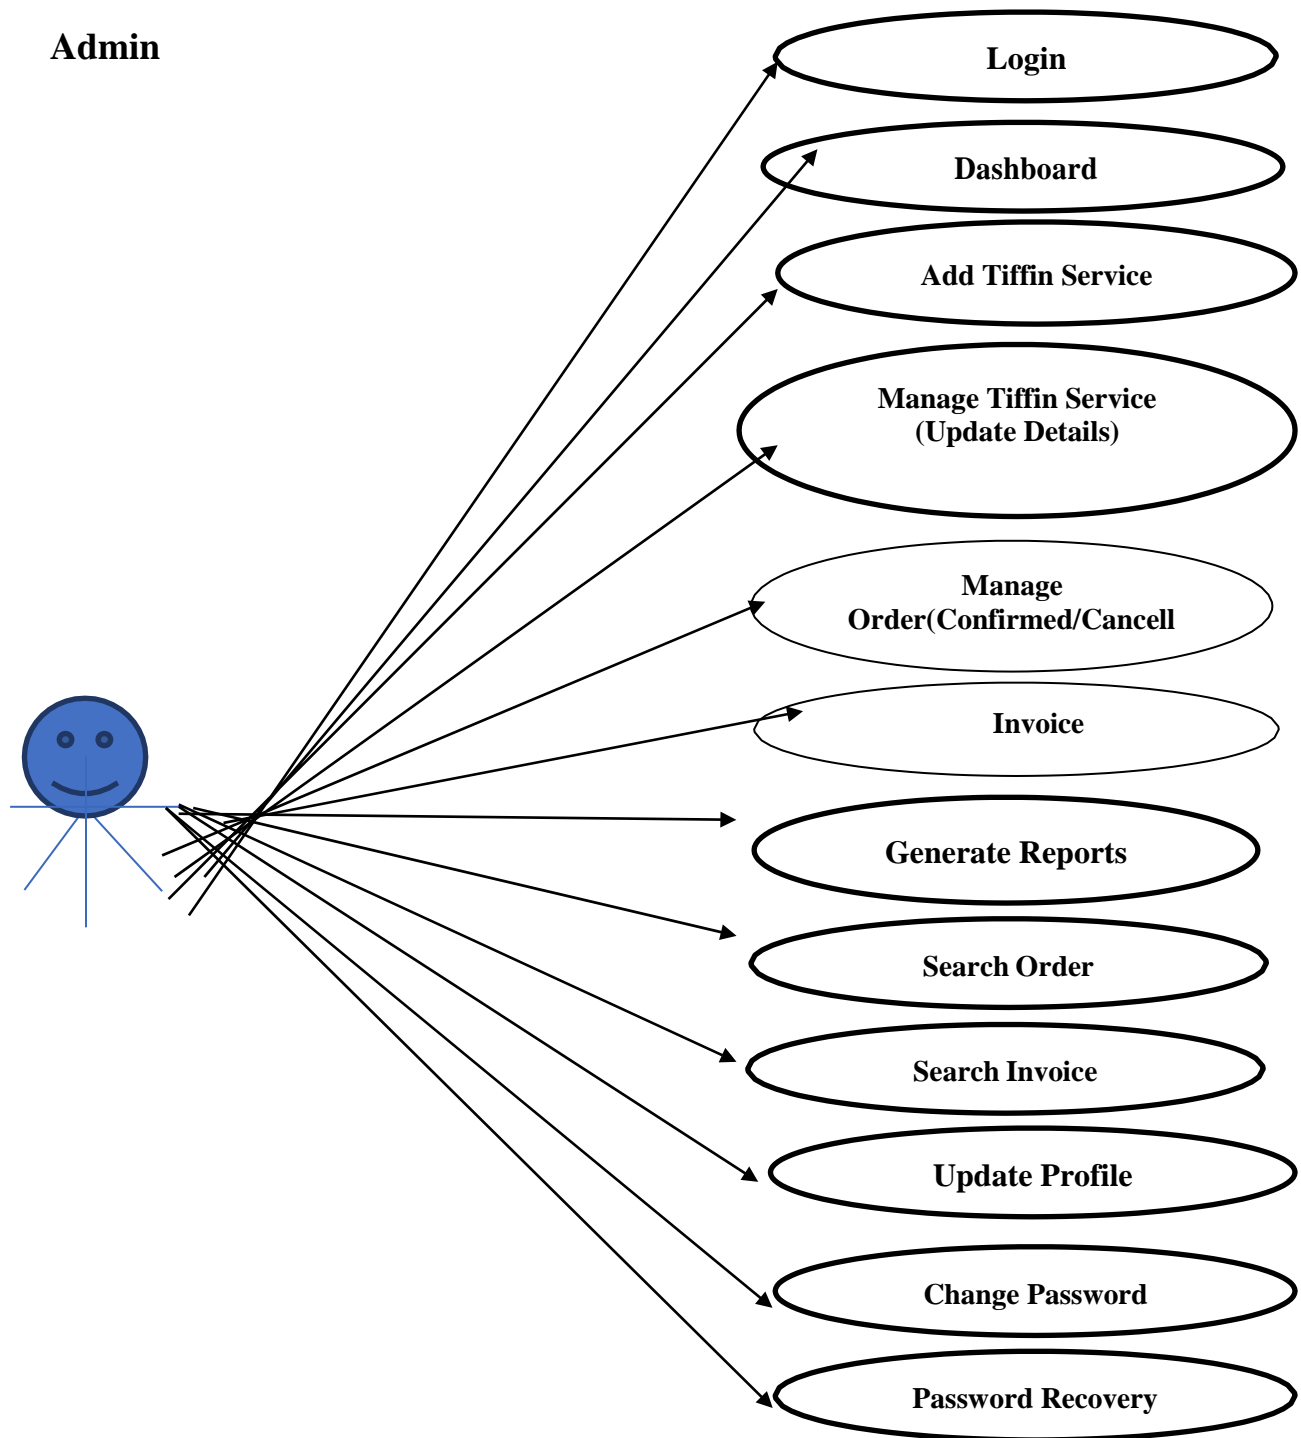

Figure 1

Users

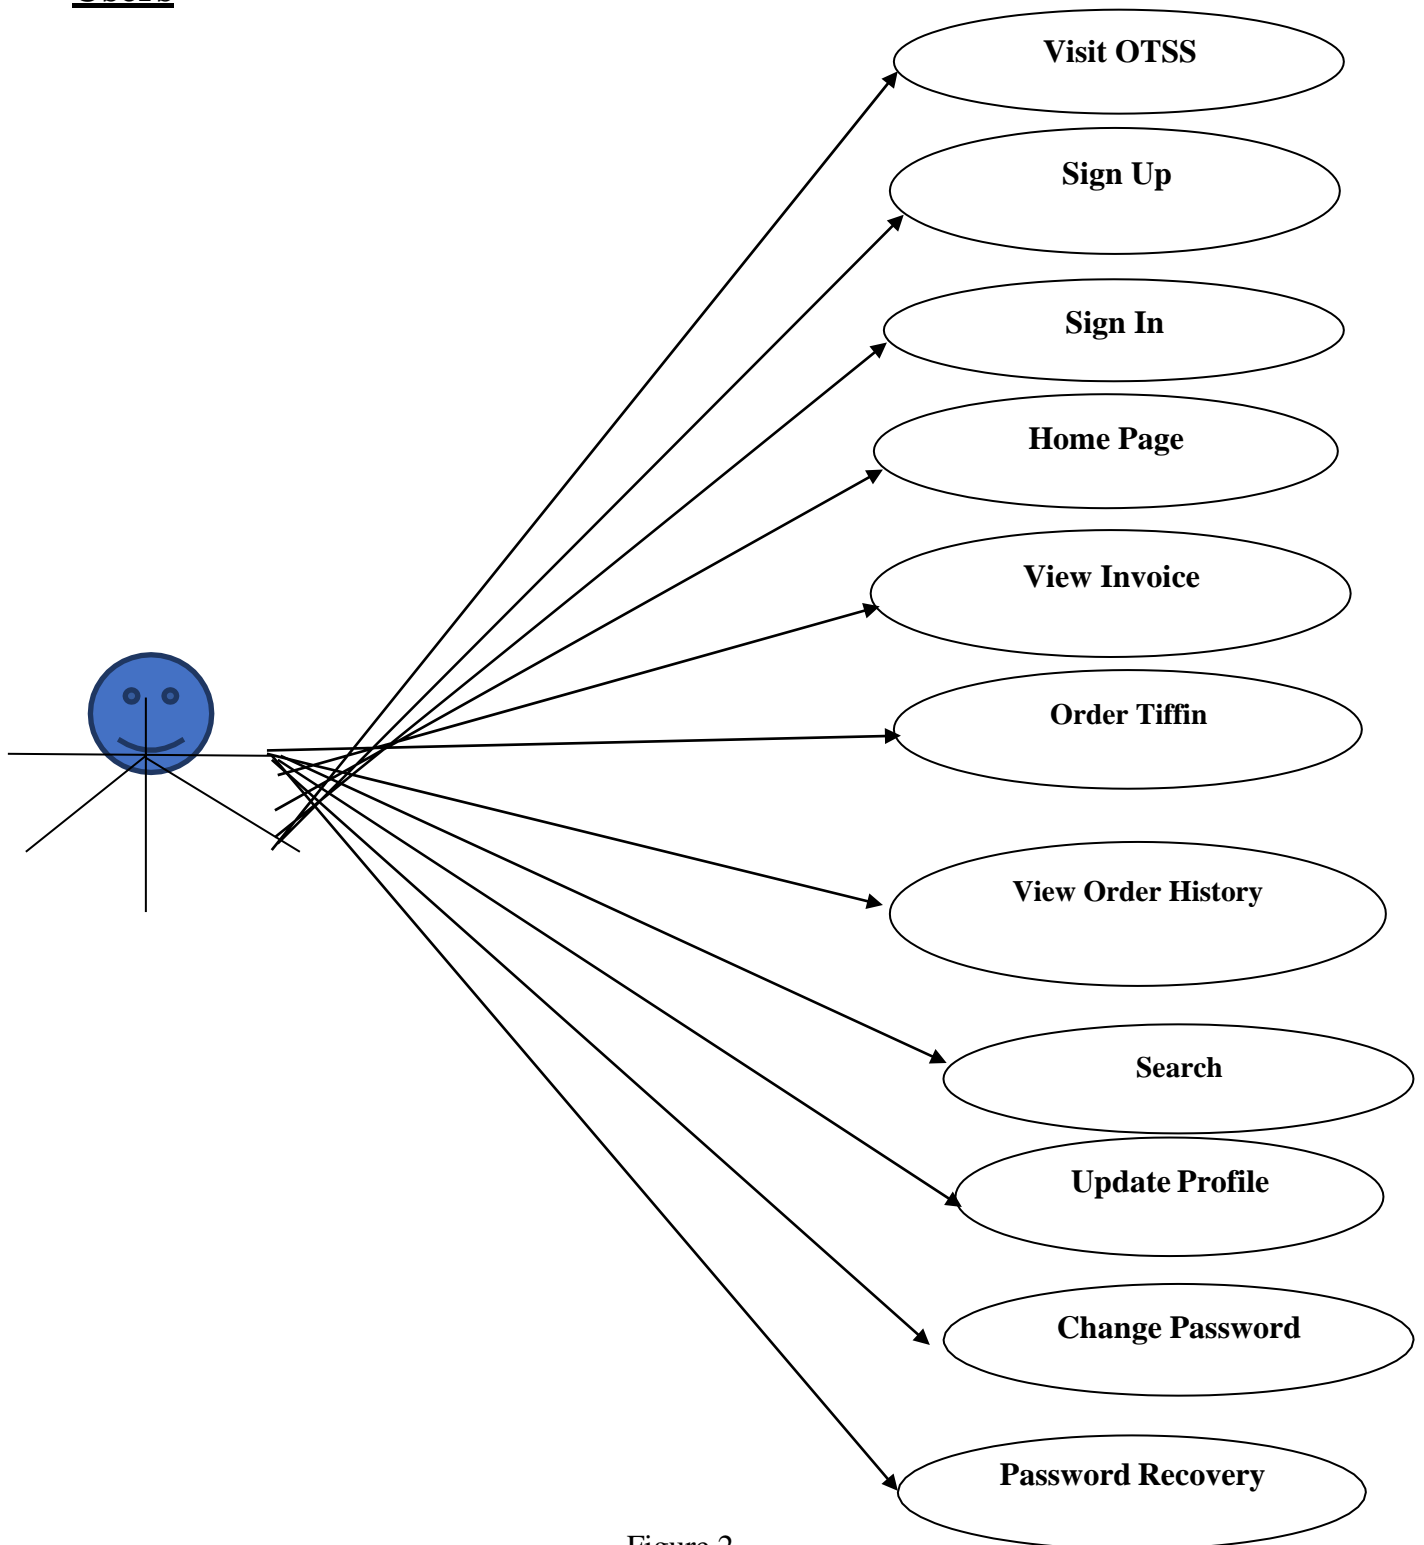

Figure 2

Class Diagram:

A description of set of objects that share the same attributes operations, relationships, and semantics

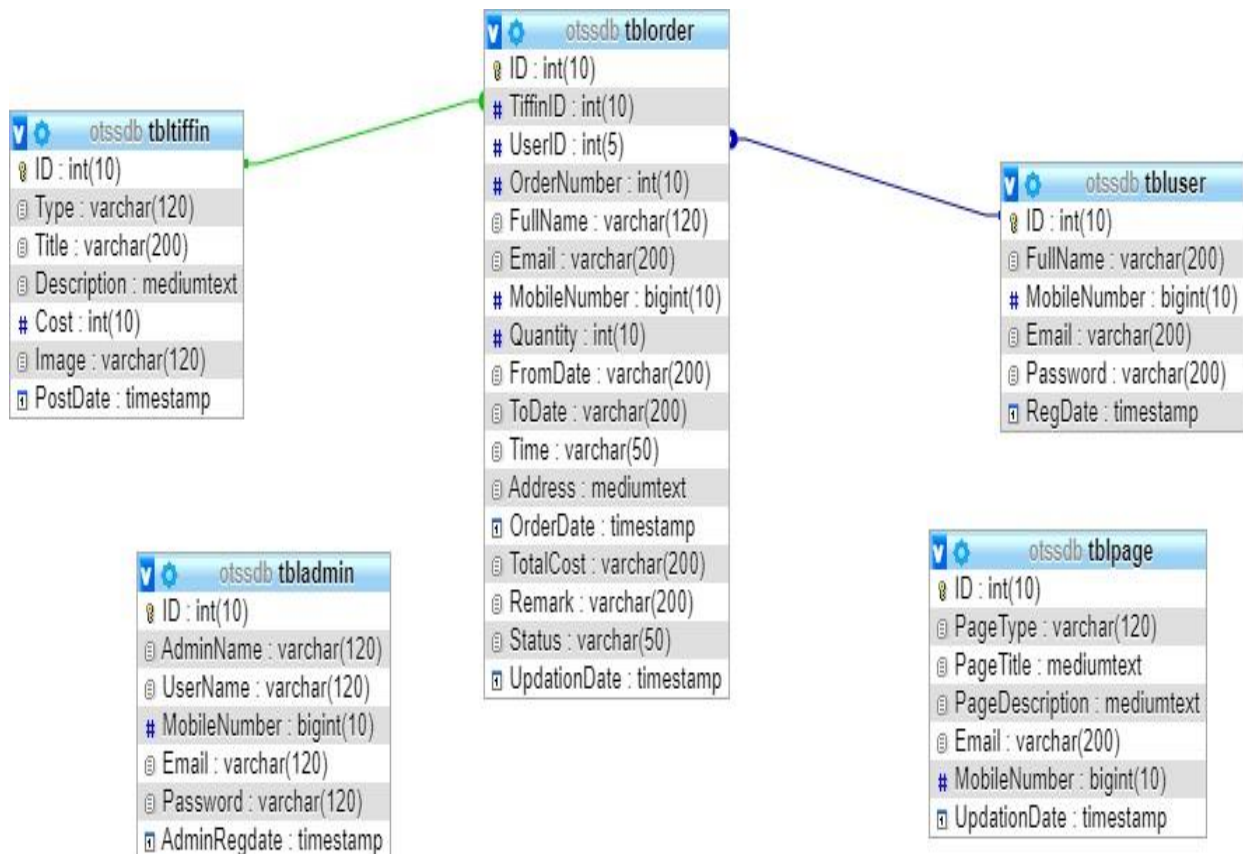

Figure 3

ER Diagram:

The Entity-Relationship (ER) model was originally proposed by Peter

in 1976 [Chen76] as a way to unify the network and relational database views. Simply stated the ER model is a conceptual data model that views the real world as entities and relationships. A basic component of the model is the Entity-Relationship diagram which is used to visually represent data objects. Since Chen wrote his paper the model has been extended and today it is commonly used for database design for the database designer, the utility of the ER model is:

- It maps well to the relational model. The constructs used in the ER model can easily be transformed into relational tables.
- It is simple and easy to understand with a minimum of training. Therefore, the model can be used by the database designer to communicate the design to the end user.
- In addition, the model can be used as a design plan by the database developer to implement a data model in specific database management software.

ER Notation

There is no standard for representing data objects in ER diagrams. Each modeling methodology uses its own notation. The original notation used by Chen is widely used in academics texts and journals but rarely seen in either CASE tools or publications by non-academics. Today, there are a number of notations used; among the more common are Bachman, crow's foot, and IDEFIX.

All notational styles represent entities as rectangular boxes and relationships as lines connecting boxes. Each style uses a special set of symbols to represent the cardinality of a connection. The notation used in this document is from Martin. The symbols used for the basic ER constructs are:

- **Entities** are represented by labeled rectangles. The label is the name of the entity. Entity names should be singular nouns.

- **Relationships** are represented by a solid line connecting two entities. The name of the relationship is written above the line. Relationship names should be verbs
- **Attributes**, when included, are listed inside the entity rectangle. Attributes which are identifiers are underlined. Attribute names should be singular nouns.
- **Cardinality** of many is represented by a line ending in a crow's foot. If the crow's foot is omitted, the cardinality is one.

Existence

It is represented by placing a circle or a perpendicular bar on the line. Mandatory existence is shown by the bar (looks like a 1) next to the entity for an instance is required. Optional existence is shown by placing a circle next to the entity that is optional.

ER Diagram

MySQL Data Tables:

Admin Table :(Table name is admin)

This store admin personal and login details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	AdminName	varchar(120)	utf8mb4_general_ci		Yes	NULL		
3	UserName	varchar(120)	utf8mb4_general_ci		Yes	NULL		
4	MobileNumber	bigint(10)			Yes	NULL		
5	Email	varchar(120)	utf8mb4_general_ci		Yes	NULL		
6	Password	varchar(120)	utf8mb4_general_ci		Yes	NULL		
7	AdminRegdate	timestamp			Yes	current_timestamp()		

Table

Order Table (Table name is tblorder)

This table store the date of order received.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	TiffinID	int(10)			Yes	NULL		
3	UserID	int(5)			No	None		
4	OrderNumber	int(10)			Yes	NULL		
5	FullName	varchar(120)	utf8mb4_general_ci		Yes	NULL		
6	Email	varchar(200)	utf8mb4_general_ci		Yes	NULL		
7	MobileNumber	bigint(10)			Yes	NULL		
8	Quantity	int(10)			Yes	NULL		
9	FromDate	varchar(200)	utf8mb4_general_ci		Yes	NULL		
10	ToDate	varchar(200)	utf8mb4_general_ci		Yes	NULL		
11	Time	varchar(50)	utf8mb4_general_ci		Yes	NULL		
12	Address	mediumtext	utf8mb4_general_ci		Yes			
13	OrderDate	timestamp			Yes	current_timestamp()		
14	TotalCost	varchar(200)	utf8mb4_general_ci		No	None		
15	Remark	varchar(200)	utf8mb4_general_ci		No	None		
16	Status	varchar(50)	utf8mb4_general_ci		Yes	NULL		
17	UpdationDate	timestamp			Yes	NULL		ON UPDATE CURRENT_TIMESTAMP()

Table 6

Page Table: (Table name is tblpage)

This store the about us and contact us details.

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	PageType	varchar(120)	utf8mb4_general_ci		Yes	NULL		
3	PageTitle	mediumtext	utf8mb4_general_ci		Yes			
4	PageDescription	mediumtext	utf8mb4_general_ci		Yes			
5	Email	varchar(200)	utf8mb4_general_ci		Yes	NULL		
6	MobileNumber	bigint(10)			Yes	NULL		
7	UpdateDate	timestamp			Yes	NULL		ON UPDATE CURRENT_TIMESTAMP()

Table 7

Tiffin Service Table: (Table name is tbltiffin)

This store the detail of tiffin service

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	Type	varchar(120)	utf8mb4_general_ci		Yes	NULL		
3	Title	varchar(200)	utf8mb4_general_ci		No	None		
4	Description	mediumtext	utf8mb4_general_ci		Yes			
5	Cost	int(10)			Yes	NULL		
6	Image	varchar(120)	utf8mb4_general_ci		Yes	NULL		
7	PostDate	timestamp			Yes	current_timestamp()		

Table 8

Registered User Table: (Table name is tbluser)

This store the detail of users

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra
1	ID 	int(10)			No	None		AUTO_INCREMENT
2	FullName	varchar(200)	utf8mb4_general_ci		Yes	NULL		
3	MobileNumber	bigint(10)			Yes	NULL		
4	Email	varchar(200)	utf8mb4_general_ci		Yes	NULL		
5	Password	varchar(200)	utf8mb4_general_ci		Yes	NULL		
6	RegDate	timestamp			Yes	current_timestamp()		

Table 9

Implementation and System Testing

After all phase have been perfectly done, the system will be implemented to the server and the system can be used.

System Testing

The goal of the system testing process was to determine all faults in our project .The program was subjected to a set of test inputs and many explanations were made and based on these explanations it will be decided whether the program behaves as expected or not. Our Project went through two levels of testing

1. Unit testing
2. Integration testing

UNIT TESTING

Unit testing is commenced when a unit has been created and effectively reviewed .In order to test a single module we need to provide a complete environment i.e. besides the section we would require

- The procedures belonging to other units that the unit under test calls
- Non local data structures that module accesses
- A procedure to call the functions of the unit under test with appropriate parameters

1. Test for the admin module

- **Testing admin login form**-This form is used for log in of administrator of the system. In this form we enter the username and password if both are correct administration page will open otherwise if any of data is wrong it will get redirected back to the login page and again ask the details

- **Report Generation:** admin can generate report from the main database.

INTEGRATION TESTING

In the Integration testing we test various combination of the project module by providing the input.

The primary objective is to test the module interfaces in order to confirm that no errors are occurring when one module invokes the other module.

New Order

The screenshot shows the 'New Tiffin Order' page in the OTSS system. The sidebar on the left contains the following navigation items: Dashboard, Tiffin, Order (highlighted), New Order, Confirmed Order, Cancelled Order, All Order, and Invoice. The main content area has a header with the OTSS logo and a user profile 'Hello, Test'. Below the header, the page title is 'New Tiffin Order' with a breadcrumb 'Home / New Tiffin Order'. The main section is titled 'New Tiffin Order' and includes a search bar and a table with one entry. The table has columns: S.No, Order Number, Name, Mobile Number, Order Date, Status, and Action. The entry shows S.No 1, Order Number 986030203, Name Test, Mobile Number 4654646546, Order Date 2020-02-26 19:29:05, Status Not Updated Yet, and an Action icon. Below the table, it says 'Showing 1 to 1 of 1 entries' and has pagination links 'Previous', '1', and 'Next'. At the bottom, there is a red text link 'Online Tiffin Service System.'.

CONCLUSION:

This Application provides a computerized and automated version of Online Tiffin Service System which will benefit the users who search Tiffin service online.

It makes entire process online and can generate reports. It has a facility of user's login where users can book tiffin service and also view their invoice details.

The Application was designed in such a way that future changes can be done easily. The following conclusions can be deduced from the development of the project.

- Automation of the entire system improves the productivity.
- It provides a friendly graphical user interface which proves to be better when compared to the existing system.
- It gives appropriate access to the authorized users depending on their permissions.
- It effectively overcomes the delay in communications.
- Updating of information becomes so easier.
- System security, data security and reliability are the striking features.
- The System has adequate scope for modification in future if it is necessary.
